(54) Title: INJECTION MOULDING DEVICE

(57) Abstract: Injection moulding device (1) consisting of two mould sections which (33, 34) can move with respect to one another and between which a mould cavity (36) is delimited. The movable mould section (33) is joined via an articulated joint (15) to the operating means (5-14) therefor which execute the closing movement. Centring means (25, 30) are present to centre the movable mould section (33) with respect to the stationary mould section when (34) the moulds close. An injection moulding device can optionally be equipped for compression-injection moulding of plastic. The operating means (5-14) can be constructed with the aid
